

SHIELD

Reserve a backup for your backup.

Protect yourself against data deletion.

As cyberattacks grow more sophisticated, just backing up your data by using Veeam Cloud Connect does not protect you from all data loss scenarios. Attackers are increasingly going after backup as well as production data. They are also aware of retention policies for your backups and rather than simply deleting your backup files, they may choose to corrupt your production data and continually run a backup job to a cloud target. This ages out any useful recovery points you may have and replaces them with backups of already corrupted data.

Backup data might also be accidentally deleted from a cloud repository or because of a mistake done during the configuration of backup jobs and settings, such as retention periods.

Complete your security plan.

Your organization already knows the value of following the 3-2-1 best practice for data protection: at least three copies of your data, on two different types of media, with at least one copy of your data in the cloud.

But the problem is, backup data might also be accidentally deleted from a cloud repository or because of a mistake done during the configuration of backup jobs and settings, such as retention periods.

Take data protection to the next level.

Prevent accidental and malicious deletion.

11:11 Insider Protection protects you from both accidental deletion of all backups from the Veeam console as well as more sophisticated cyberattacks. However, with Insider Protection, you can be confident that a copy of your backups will be available. 11:11's Insider Protection solution keeps copies of aged out backup files as well as deleted data and servers without consuming space in your cloud repository.

Internal or External Threat Protection

11:11 Insider Protection enables you to recover a full backup deleted by mistake, but more importantly, it also protects you from malicious attacks from outside threats. Backing up your data locally and offsite is no longer a catch-all solution as recent attacks show that backup files are being targeted and destroyed.

Recover from an attack.

With 11:11 Insider Protection, backup files deleted accidentally or maliciously are retained in an air-gapped directory. This file system is only accessible to 11:11 technicians. Backup files deleted will remain in this isolated folder for seven days and can be saved and transferred back to you once you are ready to restore data.

Key Features and Benefits:

- · Easy, convenient, affordable and secure
- · Straight-forward consumption model
- · All-inclusive support 24x7x365
- · Reliable restore
- · Integrated security
- Expert advice
- Fast recovery times
- · Visibility and control
